— Abstract -

17

We present the syntax, operational semantics, and typing rules of a π -calculus with linear and shared types. We use leftover typing [1] to encode our typing rules in a way that propagates linearity constraints into process continuations. We generalize the algebras on multiplicities using indexed sets of partial commutative monoids, allowing the user to choose a mix of linear, affine, gradual and shared typing. We provide framing, weakening and strengthening proofs that we then use to prove subject congruence. We show that the type system is stable under substitution and prove subject reduction.

This formalization has been fully mechanized with Agda and is available at https://github.com/umazalakain/typing-linear-pi.

1 Introduction

- The π -calculus models communication.
- why resource-aware typing
- extensional typing rules for a given syntax and operational semantics
- 28 leftover typing

29 1.1 Contribution

- 30 Machine verified formalisation of the linear pi calculus
- 31 Typing with leftovers applied to the pi calculus
- 32 Abstraction over multiplicities
- Full formalisation available in Agda

4 1.2 Notation

 $\frac{}{\mathbb{N}:Set} \qquad \frac{n:\mathbb{N}}{0:\mathbb{N}}$

Figure 1 Notation used in this paper

XX:2 Typing a linear π -calculus

Double rule for type-level definitions. We omit universe levels for brevity. Constructors are teletyped unless they are symbols. Some constructors are shared across types. They can however always be disambiguated through the type of the goal.

41 3 Syntax

- variable references (strings, locally named, de Bruijn)
- allows to ignore alpha conversion, or proofs of inequality between strings
- strings to maybe de Bruijn, names can be kept in context as well, just not doing it

$$\frac{n:\mathbb{N}}{\overline{\mathrm{VAR}_n:Set}} \qquad \qquad \frac{n:\mathbb{N}}{0:\mathrm{VAR}_n} \qquad \qquad \frac{x:\mathrm{VAR}_n}{{}_{^{1+}}x:\mathrm{VAR}_{1+n}}$$

Figure 2 Types of size n

$$\frac{n:\mathbb{N}}{\text{PROCESS}_n:Set}$$

$$\begin{aligned} \operatorname{PROCESS}_n &::= \mathbf{0}_n \\ & \mid \boldsymbol{\nu} \operatorname{PROCESS}_{1+n} \\ & \mid \operatorname{PROCESS}_n \parallel \operatorname{PROCESS}_n \\ & \mid \operatorname{VAR}_n \left(\right) \operatorname{PROCESS}_{1+n} \\ & \mid \operatorname{VAR}_n \left\langle \operatorname{VAR}_n \right\rangle \operatorname{PROCESS}_n \end{aligned}$$

4 Semantics

4.1 Structural congruence

47 congruence relationship indexed by recursive tree

8 4.2 Reduction

49 keeping track of the variable on which communication occurs

Figure 4 Structural rewriting rules indexed by recursion tree. P Q R: PROCESS_n where P, Q, or R have been omitted for brevity.

5 Linear typing rules

51 5.1 Multiplicities

52 A type system with both linear and shared resources has multiplicities 0, 1 and ω .

alignment, get rid of $1 \cdot$, $\cdot - join$, \cdot $compute^l$

5.1.1 Example type systems

55 Shared. Gradual. Affine. Linear.

56 5.2 Variable references

5.3 Contexts

- two-layered approach: types on one hand, capabilities on the other removing from context vs
- 59 keeping in context but marking it used

5.4 Typing with leftovers

5.4.1 Typing relation

- Variable references as proofs of capability
- 63 Context splits at each variable reference

6 Subject reduction

55 6.1 Framing

66 6.2 Weakening

- $_{67}$ Order preserving embeddings model a series of insertions. We only ever need one insertion
- to prove subject congruence, but there is no loss of generality.
